Invented in 1976, Snojax I is the "original" clear snow guard that may only be mechanically fastened through the roof sheet into a structural purlin or support below. Because of the unique rib straddling design, they fit most brands of screwed-down 36" panels with three 12" flats or four 9" flats. The distinctive 8 holes in the face plate provide exceptional water drainage.

Mechanical attachment only.

Placement in just isolated areas such as chimneys, doorways, vents and partial roof sections is NOT recommended.
